

IN THE CLAIMS:

Please amend the claims as follows:

Claim 1 (Original): A photographic print processing method, comprising the steps of:

representing a plurality of images arranged in a two-dimensional array on a display screen wherein images arranged at least in a one-dimensional direction in succession among said plurality of images are images processed states of which are gradually changed in at least one attribute of image proceeding; and

performing image verification based on the thus represented plurality of images.

Claim 2 (Original): The method according to claim 1, wherein said at least one attribute has a plurality of attributes of the image processing, and wherein said plurality of images represented in the two-dimensional array are arranged in each one-dimensional direction in respect to two attributes selected arbitrarily from the plurality of attributes.

Claim 3 (Original): A photographic print processing apparatus, comprising:

a device for reading an image recorded on film; and

a representation device for representing the thus read image,

wherein image processed states of which are gradually changed in at least one attribute of image processing and which are arranged at least in a one-dimensional direction are represented in succession on a screen of the representation device.

A1
Claim 4 (Original): The apparatus according to claim 3, wherein said at least one attribute has a plurality of attributes of the image processing, and wherein said plurality of images represented in the two-dimensional array are arranged in each one-dimensional direction in respect to two attributes selected arbitrarily from the plurality of attributes.

Claim 5 (NEW): A photographic print processing method, comprising the steps of:

representing a plurality of images arranged in a two-dimensional array on a display screen wherein said plurality of images are processed in one frame in different states to each other and arranged at least in a one-dimensional direction in succession are images processed states which are gradually changed in at least one attribute of image proceeding; and

performing image verification of said image in said one frame based on the thus represented plurality of images.

Claim 6 (NEW): a photographic print processing apparatus, comprising:

a device for reading an image recorded on film; and

a representation device for representing the thus read image,

wherein a plurality of images which are processed said read image in one

frame in different states to each other are arranged in a two-dimensional array on

a display screen of the representation device, and

wherein images processed states of which are gradually changed in at least

one attribute of image processing and which are arranged at least in a one-

dimensional direction are represented in succession on the display screen of the

representation device.
